Description

Status quo

At the moment, translate5 knows a single delivery date, which refers to the fact that all users assigned in the "review" workflow step have completed their task.

It is possible to send automatic reminder to the users by a nightly call of an action of the translate5 cronController.

Different delivery date and reminder for each user in the workflow

Separate delivery date

Goal of this issue is, that for every user that is assigned to a workflow role for a task a separate delivery date can be set.

Implementation details

- In the task properties user tab a new column and form field "delivery date" is added
- The current delivery date
 - is kept, but renamed to "review delivery date".
 - sets the default for the delivery date for the reviewers
 - is automatically changed to the latest delivery date that is set for an individual reviewer, if these dates are set manually for the reviewers
 - is removed from the "add task" window, but kept in the "add task" API for backwards compatibility
- A new task overview column "translation delivery date" is introduced and automatically set to the latest delivery date for an assigned translator workflow step (or otherwise empty)
- A new task overview column "translator check delivery date" is introduced and automatically set to the latest delivery date for an assigned translator check workflow step (or otherwise empty)

Reminder

For the separate delivery date of every user a reminder mail can be send by the translate5 cronController. How much time before the deadline a reminder will be send can be defined in the configuration of translate5 (and will be able to overwrite by customer with the implementation of the multiteneny feature phase 2)
